

Harness the power of your DATA

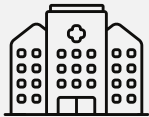

DATA

Flex Clinical Insight

Make data-supported decisions

Measure and analyse to improve processes

Provide better care

Evaluate the quality of care and operational effectiveness

Reduce healthcare costs

Avoid duplication of services

Data-Supported Decisions

Clinical Insight allows you to gain insight into your organisation-wide clinical processes and helps your staff make data-supported decisions. This leads to improved patient safety and care, streamlined clinical processes, and facilitates identifying and reducing inefficiencies and costs.

Data can be used to evaluate the quality of care through outcomes and process analysis, at risk population group monitoring and examining workflows. Clinical Insight helps you and your teams measure and report on the effectiveness of specific clinical practice patterns and pathways.

Hands-off automated flow of data

The Clinical Insight platform includes a fully automated "hands off" process. Data documented in HARRIS Flex is automatically reflected in near-real time in the Clinical Insight relational database where they are accessible for your staff via standard platforms such as PostgreSQL, Microsoft SQL Server or Oracle allowing analysis and reporting via standard tools.

Clinical Data Focus

Analyse your data to confirm trends, uncover patterns, determine root causes and more. Look at data such as the following, using Flex Clinical Insight and leverage it to analyse your workflows and improve efficiencies:

- Patients, Visits
- Orders and Results
- Treatments
- Diagnosis and Problem list
- Prescriptions and Medications
- Allergies and Symptoms
- Clinical Notes
- Procedures
- Profiles and Assessments
- Kardex and Chart review
- Providers and other prescribers
- Bed activity and utilisation

The data can thus be used with other data from financial, administrative or other systems, enabling correlations that help your staff determine how to improve care and the efficiency of processes in the healthcare organisation.

Provide Better Care

Clinical Insight enables customers to better respond to ongoing changes in governmental and regulatory compliance requirements, managing rising healthcare costs, improving medical outcomes and patient satisfaction.

It provides the required visibility to evaluate quality of care and operational effectiveness through critical data analysis. Where our HARRIS Flex system has a patient-centric point of care focus, Clinical Insight is designed for population-based analytical processing that is required to measure and improve clinical and clerical processes as well as patient outcomes.

Clinical Insight allows for the analysis of clinical data without interfering with critical day-to-day patient care practices. Data can be used to evaluate the quality of care through outcomes and process analysis, at risk population group monitoring and examining workflows.

Reduce Healthcare Costs

Avoid unnecessary services by providing the appropriate level of care in the most appropriate setting. Circumvent cost by properly sequencing a patient through the healthcare system. Clinical Insight helps measure and report the effectiveness of specific clinical practice patterns and pathways.
